MyYanga v4 - Environment & secrets (AWS / platform engineers)

Copy to .env (Vite client) and set matching **Supabase Edge secrets** for Deno functions.

Client (Vite - baked at build time)

Variable	Required	Purpose
VITE_SUPABASE_URL	Production	Supabase project URL
VITE_SUPABASE_ANON_KEY	Production	Public anon key (RLS still applies)
VITE_GOOGLE_AUTH	Optional	UI hint that Google is enabled (true)

Edge function secrets (supabase secrets set)

Secret	Function(s)	Fail-soft if missing
GOOGLE_API_KEY	virtual-tryon (Gemini 2.5 Flash Image)	Returns 501 { fallback: true } -> client canvas compositing
ANTHROPIC_API_KEY	smart-search, ai-chat	AI summary / chat degrade; search still works locally in Testing
FLUTTERWAVE_SECRET_KEY	payments	Cascade skips to next provider
PAYSTACK_SECRET_KEY	payments	Cascade skips
STRIPE_SECRET_KEY	payments	Cascade skips
SUPABASE_SERVICE_ROLE_KEY	payments, gates, webhooks	Required for Production payments / gate RPC
PUBLIC_APP_URL	payments return URLs	Use live SPA origin
RESEND_API_KEY	send-reel email	501 soft-fail; **in-app reel still delivered**
REEL_EMAIL_FROM	send-reel	Default MyYanga <reels@myyanga.com>
VAPID_PUBLIC_KEY / VAPID_PRIVATE_KEY	web push (planned)	Local Notification / queue until wired
WHATSAPP_CLOUD_TOKEN	auth-whatsapp, send-reel	OTP / Cloud send soft-fail -> Testing mock / wa.me queue
WHATSAPP_PHONE_NUMBER_ID	same	Required with Cloud token (**no BSP**)

Google stack checklist

- **Google OAuth login** - Supabase Auth -> Providers -> Google (Client ID/Secret from Google Cloud Console). Redirect allow-list must include SPA origin. Founding owner: oadeagbo@gmail.com (FOUNDING_OWNER_EMAIL + RPC claim_founding_owner in migration 007).
- **Gemini Virtual Wear** - set GOOGLE_API_KEY on the project; deploy virtual-tryon. Without key, UX remains usable via canvas.
- **Reel delivery** - in-app always works. Email needs Resend. Push needs VAPID + web-push library on edge.

WhatsApp Cloud optional; client queues wa.me / dedicated SIM manual send when Cloud secrets absent.

SPA hosting

Deploy dist/ to S3+CloudFront / Amplify / Netlify / Vercel. Configure **SPA fallback** so /look/* and deep links serve index.html.

Migrations

Apply supabase/migrations/001 through 011 (npm run sb:migrate or SQL Editor in order).

ZonicMe Limited - MyYanga v4 pre-production
